G15 endeks zorunlu provizyonlar

1. Kuruluşunuzda, yönetim ve kontrol hükümlerine aktif olarak katılan bağımsız yönetim kurulu üyeleri vardır.

2. Kuruluşunuz, yatırımcılara ve tüm paydaşlara, finansal durum ve yatırım hedefleri ile ilgili mevcut durumla tutarlı bir tavsiye sistemi sürdürmektedir.

3. Şirketinizde aktif olarak kullanılan tazminat düzenlemeleri vardır.

4. Kuruluşunuz, borç ve oy hakları açısından daha fazla hissedar ve çalışan katılımına izin vermektedir.

5. Hissedarlar, yönetim kurulu boyutunu artırmak ve azaltmak ve tüzüğü/yönetmeliği değiştirmek için kümülatif oy haklarına sahiptir.

6. Şirketinizin şu anda borç piyasasında ödenmemiş borçlanma araçları bulunmaktadır.

7. Şirketinizin hisse senedi piyasasında ödenmemiş kurumsal hisse senetleri bulunmaktadır.

8. Şirketinizin bir strateji yatırım finansman komitesi vardır.

9. Kuruluşunuzun bir ödül sistemi vardır.

10. Şirketinizin, dış kaynaklardan bilgi toplayan ve işleri ilk ve hızlı bir şekilde yapmak için mevcut piyasa durumlarını analiz eden ekipleri ve yöneticileri vardır.

11. Şirketinizin bir temettü ve kamu bilgilendirme politikası vardır. 12. Kuruluşunuzun, sermaye piyasası araçları (finansal yenilikler) ile ilgili yeni gelişmeleri yürürlükteki yasalara uygun olarak uygulama ve kullanma biçimi hakkında kamuoyunu bilgilendiren bir bilgilendirme politikası vardır.

13. Şirketiniz, yurtdışında, örneğin yabancı bir menkul kıymetler borsasında kullanılan sermaye piyasası araçlarının sonuçlarını ve faaliyetlerinin mali durumunu kanıtlarla birlikte açıklar.

14. Şirketiniz, yürürlükteki yasalara göre toplam sermayesi ve oy hakları hakkında bilgi sağlar.

15. Yönetim Kurulu tarafından gerçekleştirilen tüm işlemler kamuoyuna açıklanır.

G17 endeks zorunlu provizyonlar

1. Kuruluşta, departmanlar çalışanlara mülkiyet çıkarları ve kar paylaşım hakları hakkında doğru bilgi sağlar.

2. Tüm çalışanlara güç müzakere etme ve açıkça işbirlikçi kararlara ulaşma hakkı verilir.

3. Departmanlardaki çalışanlara bir proje üzerinde çalışmak üzere atanır.

4. Çalışanlar, ödül sisteminin ve davranış biçimleri hükümlerinin kuruluşta uygulanma biçiminden memnundur.

Çalışanların şirketlerinde hisse sahibi olmalarına izin verilir.

6. Kuruluşunuzun, ortamda rekabet avantajını korumaya yardımcı olmak için bir yönetim stratejisi (Misyon Beyanı) vardır.

7. Kuruluşunuzun, mükemmel müşteri hizmeti sağlamak için bir Müşteri Sözleşmesi (CC) politikası (standartlaştırılmış kuralların sayısı) vardır.

8. Kuruluşunuz şu anda bir yenilik üzerinde çalışmaktadır.

9. Kuruluşunuz yakın zamanda yeni bir ürün piyasaya sürdü.

10. Kuruluşunuz, yeni ürün benzersizliğini oluşturmak için yeni kaynaklar edinir.

11. Kuruluşunuz, dış takdir yetkisini korumak için işleri ilk önce yapma yönetim stratejisini sürdürür.

12. Kuruluşunuzun ürün inovasyonu hakkında bilgi bulmaya yardımcı olmak için bir Pazar Araştırması (MR) ekibi var.

13. Kuruluşunuz müşterilere geri bildirim formları sağlıyor.

14. Kuruluşunuz son on yılda bir pazar ödülü aldı.

15. Kuruluşunuz uluslararası ticaret ve kalite standartlarını takip ediyor (ör. ISO 9000).

16. Kuruluşunuz Avrupa Birliği (AB) gibi bir ticaret bloğunun üyesidir.

17. Son on yılda kuruluşunuzdan bir kar payı aldınız.

CHAPTER 5

5. Conclusions and Recommendations

5.1. Flow structure around single and multiple staggered slotted-cylinders

Heat exchangers, which are used in wide variety of industrial applications, are one of the devices that can be developed further in regard to energy-saving, from the hydrodynamics point of view. Therefore the main aim of the present study is to investigate details of flow structure in the upstream and downstream of a circular single slotted-cylinder and multiple staggered slotted-cylinders mounted on a flat surface in a narrow gaped rectangular duct in the case of confined flow which is used in plate-fin-and-tube type of heat exchangers.

It is known that multiple cylinders in staggered arrangement are more efficient then in-line tube arrangement in the case of heat transfer. With this in mind, this study examines the effect of a combination of multiple slotted-cylinders on flow characteristics. Therefore the effect of staggered arrangement of slotted-cylinders on the flow characteristic in confined flow was investigated both using dye visualization and the PIV technique. PIV experiments were carried out for single-slotted cylinder and multiple staggered slotted-cylinders.

The width of the slot is 5 mm, the diameters of the cylinders are 50 mm and the ratio of B/D is 0.1, the gap ratio G/D is 2 where the slot width is B, diameter of the cylinder is D and distance between the centers of the cylinders in the lateral direction is G. The laser sheet was located parallel to the bottom surface of the water channel at the elevation of $h_l/h_w=0.1$.

The slotted-cylinders significantly change the flow characteristics in downstream directions. The most important change occurs on the Reynolds stress concentrations and it substantially decreases the peak concentration of Reynolds stress.

Water jet-flow passing through the slot was remarkably effective for the gap ratio B/D=0.1 in case of staggered cylinder arrangements. The jet-like flow changed direction and switched from one side to the other randomly. Jet-flow between cylinders was effective and almost symmetrical wake region in downstream direction for Re_d=1500 and Re_d=4000. At the bottom surface plane (h_l/h_w=0.1), the analysis of the instantaneous flow data and time-averaged velocity vectors map, <V> patterns of streamlines, <ψ> and corresponding vorticity contours, <ω>, Reynolds stress correlations <uv′>/U and fluctuations of the velocity components shows that the horseshoe vortices take place in the base of the cylinder in three dimensional forms causing a scour mechanisms. These vortices also magnify the entrainment process and circulatory motions between core and wake flow regions downstream of the cylinder mounted on the flat plate in confined flow

Control of jet-like-flow both on the shoulders of slotted-cylinders and in the slot along the cylinder provides the absence of biased flow. In terms of the size of the wake region, wake region elongates in streamwise direction due to the momentum transfer from the slot of the cylinder in case of single slotted-cylinder. The vortex shedding., Kelvin-Helmholtz instabilities in the shear layer become effective on the flow characteristics downstream of the cylinder.

5.2. Flow Control around Slotted-Cylinders

In this section, flow characteristics of circular slotted-cylinders arrangement

Has been investigated experimentally. Experiments were only carried out for the gap ratio of G/D=2 and B/D=0.1. During the experiments, Reynolds numbers were changed between 1500 and 4000. The cylinders having same slot widths were used during the experiments. All experiments were carried out at elevation of h_l/h_w=0.1. The slot width has an effect on the flow characteristics. The peak value of Reynolds shear stress concentration decreases due to slot width.

Following conclusions can be derived from the overall experimental studies.

·A test model geometry comprised of multiple slotted-cylinders row surrounded by a fin plate configuration should be considered in the context of optimization and design of plate fin and tube heat exchangers. Fluid flow and corresponding heat transfer characteristics of multiple row heat exchanger geometry can be extended to investigate for different ratio of B/D for fin and tube heat exchangers.

·Tube row number, tube arrangement with slot, fin configuration and Reynolds number are important governing design parameters for the plate fin and tube heat exchangers.

·The heat transfer rate increases with an increase of the Reynolds number.

·Staggered slotted-cylinders arrangements enhance the heat transfer rate hydrodynamically, even in wake-flow region compared to the arrangement of multiple in-line cylinders since staggered cylinder arrangements activate the flow behaviours further because of the repetition of boundary-layer development.

·The magnitude of the pressure drop along the tube surface in the staggered slotted arrangement is found to be lower comparing staggered arrangement without slot.

·A continous flow development, involving shearing phenomena and interactions of shedding and horseshoe vortices, causes a high rate of fluctuations and heat transfer over the whole flow field. For the staggered arrangement with slot has higher heat transfer rate than for the inlined arrangement.

·The distributions of the time-averaged flow data for multiple slotted-cylinders demonstrate that the wake-flow region is shortened in size in the longitudinal direction but slightly enlarged in size in the lateral direction, comparing

·The size of the wake region differs slightly depending on the Reynolds number for single slotted-cylinder but not multiple slotted-cylinders. As the Reynolds number is increased, the size of the wake region becomes smaller.

·The positive and the negative vorticity layers are approximately equal and symmetric with each other.

5.3. Recommendations for Future Work

The present work focused on the flow control for single and staggered slotted arrangement of cylinders in confined flow which is similar to heat exchanger flow passage. The flow behavior in the heat exchanger flow passage

is really a complex, three-dimensional and unsteady with flow separation, reattachment, recirculation zones, and vortices in the wake of the cylinders.

The present study can be further extended heat transfer aspect of plate fin and tube heat exchangers. Different control techniques can be also used to control vortex formation around staggered arrangements of slotted-cylinders.

In addition to that, the study may be further extended to investigate effects of tube diameter, slot width, effects of different tube shapes having oval or elliptical configurations, and effects of transverse and longitudinal distance between the tubes on the flow and heat transfer characteristics of plate fin and tube heat exchangers.

Besides three dimensional experimental investigations with 3-D PIV system can be undertaken to measure the third velocity component over a complete flow field of the confined flow of multiple slotted-cylinders.

Spinal cord injuries are more commonly seen in sports that involve frequent contact or high-speed movements. These types of injuries are particularly prevalent in contact sports such as American football, soccer, wrestling, rugby, and hockey, as well as in high-speed sports like motorcycling, surfing, and skiing, and activities such as mountaineering and gymnastics. Sudden movements and high-risk factors inherent to these sports significantly increase the risk of spinal cord injury (Boden & Jarvis, 2009).
